Course Description
As a research tool in the social sciences, GIS have not been used to nearly the same depth relative to applications in the natural sciences, in which GIS have a longer history dating back to the late 1960s. Current and future opportunities for the application of GIS in the social sciences are considered tremendous. This course aims to point at some of the many opportunities. Whether the research design is based on qualitative or quantitative methods, GIS can provide the researcher with added analytical capabilities. Examples from both qualitative and quantitative use of GIS will be given during the course, but with an emphasis on the latter.
